

Optimizing Outcomes for Adults

One of the primary concerns for families of those with 22q11.2 Deletion syndrome (22q11.2DS) is how things will unfold over the long term. Our clinic is devoted to the care of individuals 17 years of age and older with 22q11.2DS and their families. Learning from every patient and family we see, we have developed practical strategies for assessing and managing health concerns - both those that arise in adolescence and adulthood, and those that continue from childhood. We aim to optimize long term outcomes for each individual.
